Lougheed Township, Ontario.

Scale: 1 inch to 4 miles

N.T.S. 42-B-7

LOUGHEED 1-83

LOCATION AND ACCESS

The property is situated within the Kapuskasing Structural Zone in the southwest corner of Lougheed Township, the Porcupine Mining Division, in Northeastern Ontario. The nearest community in the area is Elsas, a small hamlet located on the C.N.R. mainline approximately 60 km northwest of Foleyet, Ontario. Access to the property can be gained by rail or float plane from Foleyet.

CONCLUSIONS

The property is underlain by a diverse sequence of mafic to felsic ortho and paragneiss. The dominant foliation is roughly east-west with highly variable south dips.

Two separate magnetite iron formation are exposed on the property. They are well preserved compared to the surrounding lithology, and exibit primary bedding features.

PROPERTY STATUS

Lougheed 1-83 consists of sixteen contiguous unpatented mining claims numbered P-725914, P-725929, inclusive, staked during the period June 17, 18 and 19, 1983. The anniversary date for the claims is July 18, 1984. To date there is inadequate assessment work completed to hold all of the claims past their anniversary date, as a portion of the claims require winter work. A total of 11 km of grid was cut and mapping was carried out on August 9, 1983 over 8 of the 16 claims covering the central portion of the claims.

TOPOGRAPHY

Relief in the claim block is moderate with a maximum of 150' on the immediate claims. The area is covered by an overmature poplar, birch and spruce forest with heavy undergrowth of alder and hazel.

PREVIOUS WORK

The area covered by the claims and the south part of the present survey was under option to the Mining Corporation of Canada Ltd., in 1957 as a magnetite showing. Assays of 16.62% Fe and 18.02% Fe were obtained. No other work was recorded.

REGIONAL GEOLOGY

The Oatland project area is situated within the Kapuskasing Structural Zone, a northeast trending zone of high grade metamorphic rocks. The structure appears to be fault bounded on the southeast but displays a gradational contact to the west into low grade volcanic rocks of the Michipicoten-Wawa greenstone belt.

The Kapuskasing Structural Zone comprises generally northeast-striking, northwest dipping belts of mafic, intermediate and felsic volcanic gneisses and broad areas of sedimentary gneiss. The southern part of the Oatland project area has been intruded by the Shenango alkali intrusive complex.

The Shenango complex is composed of a monzonitic core and a peripheral unit of syenodiorite and hornblende syenite. Numerous offshoots of hornblende syenite occur to the northwest of the main intrusive body.

The orientation of gneissosity and lithological contacts make up the prominent east-northeast structural grain of the structural zone. The gneissosity in all rock types is folded about gently plunging northeast trending axes. Plunge reversals are common and can be related to a gently southeast plunging warp axis.

Faulting in the area is predominantly northeast with diabase dykes occupying many of the fault zones. Locally cataclastic gneissic breccias are recognized.

Overall metamorphism in the structural zone is granulite facies with local areas of retrograde metamorphism to upper greenschist facies.

PROPERTY GEOLOGY

The Lougheed 1-83 property is underlain by a diverse sequence of mafic to felsic gneisses and thick, monotonous sedimentary gneiss sequences. Oxide and silicate facies Banded Iron Formation is exposed on the north and south portions of the map area. The iron formation is generally low in magnetite content.

A thick, monotonous sequence of metasedimentary gneiss underlies the central portion of the map area. Stratigraphy becomes much more diverse, with mafic to intermediate amphibolitic gneiss and felsic to siliceous gneiss all occuring in the vicinity of the iron formation.

TABLE OF FORMATIONS

Unit 8	Diabase
Unit 7	Felsic Intrusive
Unit 6	Mafic Intrusive
Unit 5	Chemical Sediment (chert, B.I.F., carbonate)
Unit 4	Volcaniclastic to Clastic Sediment
Unit 3	Felsic Gneiss (Rhyolitic to Dacitic ?)
Unit 2	Intermediate Gneiss (Andesitic ?)
Unit 1	Mafic Gneiss (Basaltic to Andesitic ?)

TEXTURAL DISCRIPTIONS

gn - gneissic

g - granitic

MAFIC VOLCANIC GNEISS

Mafic amphibolitic gneisses occur as both thick, discrete units and thinner intercalated units within both felsic gneisses and sedimentary gneisses. They are black to dark green in colour, usually medium grained although some phases are extremely coarse grained, and generally exhibit a distinct gneissic texture. Mineralogically, amphibole is dominant with subordinate plagioclase and red garnet, which can vary from 5 to 25% of the rock. Garnets appear to be obiquitous throughout the stratigraphic assemblage.

FELSIC VOLCANIC GNEISS

Felsic gneisses occur as finely banded quartzitic and quartzofeldspathic units with intercalated mafic gneiss bands, and as thicker, less foliated units that exhibit a fragmental nature. Mafic fragments are often present within the felsic gneisses, but their appearance is erratic. Garnets are present, but to a lesser degree.

"QUARTZITE" (SILICEOUS IRON FORMATION):

Pyrrhotite-magnetite siliceous iron formation occurs as a distinct marker unit within the mafic and felsic gneisses. Coarse recrystallized silica makes up the majority of the unit, which varies in thickness from 5m to 15m, while magnetite with minor pyrrhotite make up anywhere from 3% to 20% of the rock. Where exposed on surface, magnetite occurs much more frequently than pyrrhotite. Garnets are present but are confined to the magnetite-pyrrhotite phases of the unit.

SEDIMENTARY GNEISS

Garnetiferous sedimentary gneisses are generally fine-grained, variable in composition from quartzofeldspathic to amphibolitic, and exhibit a granular or gritty texture in fresh surfaces. The mafic component is always amphibole and biotite with amphibole the more common constituant. Mafic gneisses are commonly intercalated with the sediments.

STRUCTURAL GEOLOGY

Trends of the individual units are generally east-west with units exhibiting gentle south dips in the 25-30 degree range with the exception of the "quartzitic" siliceous iron formation, which dips from 60 to 80 degrees to the south. The area is cut by numerous local faults which trend approximately N60 degrees E with only minor lateral displacement. The iron formation appears to be displaced by a north trending dextral strike slip fault with a lateral displacement of approximately 1 km. The fault cuts through the center of the grid.

MINERALIZATION

Lean, oxide facies banded iron formation has been observed in outcrop in two separate areas on the property. On the northwest part of claim P-725927, a 12 meter wide iron formation is exposed and has been traced along strike for 200 meters.

On the central portion of the claims near the southeast corner of claim P-725922, 5 meters of lean magnilite iron formation is exposed. This unit can be traced for 125 meters along strike.

Minor disseminated pyrrhotite occurs in a garnetiferous cherty, siliceous unit on the southeast corner of the mapped area.

STATEMENT OF QUALIFICATION

I, JAMES C. IRELAND, OF 147 WENDE AVENUE, TIMMINS, ONTARIO, HEREBY DECLARE THAT:

1. I AM A GRADUATE IN GEOLOGY FROM LAURENTIAN UNIVERSITY, SUDBURY, ONTARIO AND DID GRADUATE IN 1982.

2. I AM A QUALIFIED GEOLOGIST PRESENTLY EMPLOYED BY NORANDA INC., AND HAVE WORKED IN THEIR EMPLOY SINCE 1982.

3. I WAS DIRECTLY INVOLVED IN THE WORK CARRIED OUT ON THE PROPERTY DESCRIBED AND DID SUPERVISE, ON-SITE, THE WORK DESCRIBED.

4. I HAVE NO PERSONAL INTEREST IN THE PROPERTY DESCRIBED AND DID CARRY OUT THE WORK SOLELY FOR THE INTEREST OF NORANDA INC.

5. THE STATEMENTS MADE IN THIS REPORT ARE TRUE AND ACCURATE WITHIN THE LIMITS OF MY ABILITY.

DATED: August 9, 1984

Dear Sir:

RE: Notice of Intent dated September 4, 1984
Geological Survey on Mining Claims P 725922
et al in the Township of Lougheed

The assessment work credits, as listed with the above-mentioned Notice of Intent, have been approved as of the above date.

Please inform the recorded holder of these mining claims and so indicate on your records.

Yours sincerely,

S.E. Yundt
Director
Land Management Branch

Dear Sir:

Enclosed are two copies of a Notice of Intent with statements listing a reduced rate of assessment work credits to be allowed for a technical survey. Please forward one copy to the recorded holder of the claims and retain the other. In approximately fifteen days from the above date, a final letter of approval of these credits will be sent to you. On receipt of the approval letter, you may then change the work entries on the claim record sheets.

For further information, if required, please contact Mr. R.J. Pichette at 416/965-4888.

Yours sincerely,

Notice of Intent

for Technical Reports

1984 09 04

2.7056/291-84

An examination of your survey report indicates that the requirements of The Ontario Mining Act have not been fully met to warrant maximum assessment work credits. This notice is merely a warning that you will not be allowed the number of assessment work days credits that you expected and also that in approximately 15 days from the above date, the mining recorder will be authorized to change the entries on his record sheets to agree with the enclosed statement. Please note that until such time as the recorder actually changes the entry on the record sheet, the status of the claim remains unchanged.

If you are of the opinion that these changes by the mining recorder will jeopardize your claims, you may during the next fifteen days apply to the Mining and Lands Commissioner for an extension of time. Abstracts should be sent with your application.

If the reduced rate of credits does not jeopardize the status of the claims then you need not seek relief from the Mining and Lands Commissioner and this Notice of Intent may be disregarded.

If your survey was submitted and assessed under the "Special Provision-Performance and Coverage" method and you are of the opinion that a re-appraisal under the "Man-days" method would result in the approval of a greater number of days credit per claim, you may, within the said fifteen day period, submit assessment work breakdowns listing the employees names, addresses and the dates and hours they worked. The new work breakdowns should be submitted direct to the Land Management Branch, Toronto. The report will be re-assessed and a new statement of credits based on actual days worked will be issued.
